

Press Release September 2009

Exir Broadcasting displays low-power combiner at IBC

Among the many new products on display at IBC 2009 this September was Exir Broadcasting's compact, low-power UHF combiner targeting needs for cost-efficient gapfiller solutions.

The new constant impedance combiner from the Swedish manufacturer comes in a very compact package completely optimized for gapfiller applications. Designed for 19" rack assembly, the combiner has a height of just 1U and is fully UHF tunable without requiring the replacement of any parts. According to Niclas Rosvall, Senior System Design Manager at Exir Broadcasting, the combiner offers "exceptional performance and stability for a combiner as compact and flexible as this." The new unit is built for a maximum input power of 10 W rms, and is available as a 4-pole model for close channel spacing.
